

Part 2: Exploratory Data Analysis

(b) dplyr

Overview

- ▶ Visualisation is an important tool for insight generation, but it's rare that you get the data in exactly the right form you need" (Wickham and Grolemund 2017)
 - ▶ Create new variables
 - ▶ Create summaries
 - ▶ Order data
- ▶ dplyr package is designed for data transformation

dplyr

- ▶ All verbs (functions) work similarly
- ▶ The first argument is a data frame/tibble
- ▶ The subsequent arguments decide what to do with the data frame
- ▶ The result is a data frame (supports chaining of steps)

Function	Purpose
filter()	Pick observations by their values
arrange()	Reorder the rows
select()	Pick variables by their names
mutate()	Create new variables with functions of existing variables
summarise()	Collapse many values down to a single summary

Figure 1: Key dplyr functions

Sample Data set ggplot2::mpg

```
## Observations: 234
## Variables: 11
## $ manufacturer <chr> "audi", "audi", "audi", "audi", "au
## $ model          <chr> "a4", "a4", "a4", "a4", "a4", "a4"
## $ displ          <dbl> 1.8, 1.8, 2.0, 2.0, 2.8, 2.8, 3.1,
## $ year           <int> 1999, 1999, 2008, 2008, 1999, 1999
## $ cyl            <int> 4, 4, 4, 4, 6, 6, 6, 4, 4, 4, 4, 6
## $ trans          <chr> "auto(l5)", "manual(m5)", "manual(m
## $ drv            <chr> "f", "f", "f", "f", "f", "f", "f",
## $ cty            <int> 18, 21, 20, 21, 16, 18, 18, 18, 16
## $ hwy            <int> 29, 29, 31, 30, 26, 26, 27, 26, 25
## $ fl             <chr> "p", "p", "p", "p", "p", "p", "p",
## $ class          <chr> "compact", "compact", "compact", "c
```

(1) filter()

- ▶ Subset observations based on their values.
- ▶ First argument the name of the data frame
- ▶ Subsequent arguments are expressions that filter the data frame
- ▶ Only includes rows that have no missing values

```
filter(mpg,manufacturer=="audi",year==1999,model=="a4")
```

```
## # A tibble: 4 x 11
```

```
##   manufacturer model displ  year   cyl trans  drv      ct  
##   <chr>          <chr> <dbl> <int> <int> <chr>  <chr> <int>  
## 1 audi          a4      1.8  1999     4 auto(~ f      1  
## 2 audi          a4      1.8  1999     4 manua~ f      2  
## 3 audi          a4      2.8  1999     6 auto(~ f      1  
## 4 audi          a4      2.8  1999     6 manua~ f      1
```

Cars with highest mpg, lowest mpg?

```
filter(mpg,hwy==max(hwy))
```

```
## # A tibble: 2 x 11
```

```
##   manufacturer model   displ  year   cyl trans  drv      ct  
##   <chr>          <chr> <dbl> <int> <int> <chr> <chr> <int>  
## 1 volkswagen    jetta    1.9  1999     4 manu~ f      3  
## 2 volkswagen    new b~    1.9  1999     4 manu~ f      3
```

```
filter(mpg,hwy==min(hwy))
```

```
## # A tibble: 5 x 11
```

```
##   manufacturer model   displ  year   cyl trans  drv      ct  
##   <chr>          <chr> <dbl> <int> <int> <chr> <chr> <int>  
## 1 dodge         dakot~    4.7  2008     8 auto~ 4  
## 2 dodge         duran~    4.7  2008     8 auto~ 4  
## 3 dodge         ram 1~    4.7  2008     8 auto~ 4  
## 4 dodge         ram 1~    4.7  2008     8 manu~ 4  
## 5 jeep          grand~    4.7  2008     8 auto~ 4
```

Challenge 2.1

- ▶ List the cars with an average city mpg greater than the median.
- ▶ Show the cars with the maximum displacement

(2) arrange()

- ▶ Changes the order of rows.
- ▶ Takes a data frame and a set of column names to order by

```
arrange(mpg,displ)
```

```
## # A tibble: 234 x 11
##   manufacturer model displ  year   cyl trans  drv      ct
##   <chr>         <chr> <dbl> <int> <int> <chr> <chr> <int>
## 1 honda        civic   1.6  1999     4 manu~ f      2
## 2 honda        civic   1.6  1999     4 auto~ f      2
## 3 honda        civic   1.6  1999     4 manu~ f      2
## 4 honda        civic   1.6  1999     4 manu~ f      2
## 5 honda        civic   1.6  1999     4 auto~ f      2
## 6 audi         a4      1.8  1999     4 auto~ f      1
## 7 audi         a4      1.8  1999     4 manu~ f      2
## 8 audi         a4 q~   1.8  1999     4 manu~ 4      1
## 9 audi         a4 q~   1.8  1999     4 auto~ 4      1
## 10 honda        civic   1.8  2008     4 manu~ f      2
## # ... with 224 more rows
```

Show in descending order

```
arrange(mpg, desc(displ))
```

```
## # A tibble: 234 x 11
```

```
##   manufacturer model displ year cyl trans drv  ct
```

```
##   <chr>          <chr> <dbl> <int> <int> <chr> <chr> <int>
```

```
## 1 chevrolet    corv~    7    2008     8 manu~ r    1
```

```
## 2 chevrolet    k150~   6.5    1999     8 auto~ 4    1
```

```
## 3 chevrolet    corv~   6.2    2008     8 manu~ r    1
```

```
## 4 chevrolet    corv~   6.2    2008     8 auto~ r    1
```

```
## 5 jeep         gran~   6.1    2008     8 auto~ 4    1
```

```
## 6 chevrolet    c150~    6    2008     8 auto~ r    1
```

```
## 7 dodge        dura~   5.9    1999     8 auto~ 4    1
```

```
## 8 dodge        ram ~   5.9    1999     8 auto~ 4    1
```

```
## 9 chevrolet    c150~   5.7    1999     8 auto~ r    1
```

```
## 10 chevrolet   corv~   5.7    1999     8 manu~ r    1
```

```
## # ... with 224 more rows
```

Add an extra sort column

```
arrange(mpg, desc(year), desc(displ))
```

```
## # A tibble: 234 x 11
```

```
##   manufacturer model displ year   cyl trans  drv    ct
```

```
##   <chr>          <chr> <dbl> <int> <int> <chr> <chr> <int>
```

```
## 1 chevrolet     corv~   7    2008     8 manu~ r     1
```

```
## 2 chevrolet     corv~  6.2    2008     8 manu~ r     1
```

```
## 3 chevrolet     corv~  6.2    2008     8 auto~ r     1
```

```
## 4 jeep          gran~  6.1    2008     8 auto~ 4     1
```

```
## 5 chevrolet     c150~   6    2008     8 auto~ r     1
```

```
## 6 dodge         dura~  5.7    2008     8 auto~ 4     1
```

```
## 7 dodge         ram ~   5.7    2008     8 auto~ 4     1
```

```
## 8 jeep          gran~  5.7    2008     8 auto~ 4     1
```

```
## 9 toyota        land~  5.7    2008     8 auto~ 4     1
```

```
## 10 nissan        path~  5.6    2008     8 auto~ 4     1
```

```
## # ... with 224 more rows
```

(3) `select()`

- ▶ It is not uncommon to get datasets with hundreds, or even thousands, of variables
- ▶ A challenge is to narrow down on the variables of you're interested in
- ▶ `select()` allows you to rapidly zoom in on a useful subset using operations based on the variable names

```
select(mpg,model,year,displ, cty, hwy)
```

```
## # A tibble: 234 x 5
```

```
##   model      year displ   cty   hwy
##   <chr>    <int> <dbl> <int> <int>
## 1 a4      1999   1.8    18    29
## 2 a4      1999   1.8    21    29
## 3 a4      2008    2     20    31
## 4 a4      2008    2     21    30
## 5 a4      1999   2.8    16    26
## 6 a4      1999   2.8    18    26
## 7 a4      2008   3.1    18    27
```

Special Function with select

Special functions

As well as using existing functions like `:` and `c`, there are a number of special functions that only work inside `select`

- `starts_with(x, ignore.case = TRUE)`: names starts with `x`
- `ends_with(x, ignore.case = TRUE)`: names ends in `x`
- `contains(x, ignore.case = TRUE)`: selects all variables whose name contains `x`
- `matches(x, ignore.case = TRUE)`: selects all variables whose name matches the regular expression `x`
- `num_range("x", 1:5, width = 2)`: selects all variables (numerically) from `x01` to `x05`.
- `one_of("x", "y", "z")`: selects variables provided in a character vector.
- `everything()`: selects all variables.

Figure 2: Special functions with select

(4) mutate()

- ▶ It is often useful to add new columns that are functions of existing columns
- ▶ mutate() always adds new columns at the end of your data set.

```
sml <- select(mpg,model,displ,cty)
sml <- mutate(sml,Category=ifelse(cty>mean(cty),"AboveAvr",
sml
```

```
## # A tibble: 234 x 4
##   model      displ  cty Category
##   <chr>      <dbl> <int> <chr>
## 1 a4          1.8    18 AboveAvr
## 2 a4          1.8    21 AboveAvr
## 3 a4          2      20 AboveAvr
## 4 a4          2      21 AboveAvr
## 5 a4          2.8    16 BelowAvr
## 6 a4          2.8    18 AboveAvr
## 7 a4          3.1    18 AboveAvr
## 8 a4 quattro  1.8    18 AboveAvr
```

Useful creation functions

- ▶ There are many functions for creating new variables that can be used with `mutate()`
- ▶ The key property is that the function must be vectorised:
 - ▶ It must take a vector of values as input, and,
 - ▶ Return a vector with the same number of values as output

Grouping	Examples
Arithmetic Operators	<code>+</code> , <code>-</code> , <code>*</code> , <code>/</code> , <code>^</code>
Modular Arithmetic	<code>%/%</code> - Integer division <code>&&</code> - Remainder
Logs	<code>log()</code> , <code>log2()</code> , <code>log10()</code>
Offsets	<code>lead()</code> and <code>lag()</code> Find when values change <code>x!=lag(x)</code>
Cumulative and rolling aggregates	<code>cumsum()</code> , <code>cumprod()</code> , <code>cummin()</code> , <code>cummax()</code> , <code>cummean()</code>
Logical comparisons	<code><</code> , <code><=</code> , <code>></code> , <code>>=</code> , <code>!=</code>
Ranking	<code>min_rank()</code>

Figure 3: Creation functions with `mutate()`

(5) summarise()

- ▶ The last key verb is summarise()
- ▶ It collapses a data frame into a single row
- ▶ Not very useful unless paired with group_by()
- ▶ Very useful to combine with the pipe operator %>%
- ▶ The pipe %>% comes from the magrittr package (Stefan Milton Bache)
- ▶ Helps to write code that is easier to read and understand
 - ▶ `x %>% f(y)` turns into `f(x, y)`

```
mpg %>% select(model, displ, cty) %>% slice(1:2)
```

```
## # A tibble: 2 x 3
##   model displ  cty
##   <chr> <dbl> <int>
## 1 a4     1.8     18
## 2 a4     1.8     21
```

The function `group_by()`

- ▶ Most summary data operations are useful done on groups defined by variables in the the dataset.
- ▶ The `group_by` function takes an existing `tbl` and converts it into a grouped `tbl` where operations can then performed “by group”.

```
gr <- group_by(mpg,year)
agg <- summarise(gr,AverageCty=mean(cty))
agg
```

```
## # A tibble: 2 x 2
##   year AverageCty
##   <int>      <dbl>
## 1  1999      17.0
## 2  2008      16.7
```

Using %>%

```
mpg %>% group_by(manufacturer) %>%  
  summarise(AvrCty=mean(cty),N=n()) %>%  
  arrange(desc(AvrCty)) %>%  
  slice(1:5)
```

```
## # A tibble: 5 x 3  
##   manufacturer AvrCty      N  
##   <chr>         <dbl> <int>  
## 1 honda          24.4      9  
## 2 volkswagen     20.9     27  
## 3 subaru         19.3     14  
## 4 hyundai        18.6     14  
## 5 toyota         18.5     34
```

Overall idea

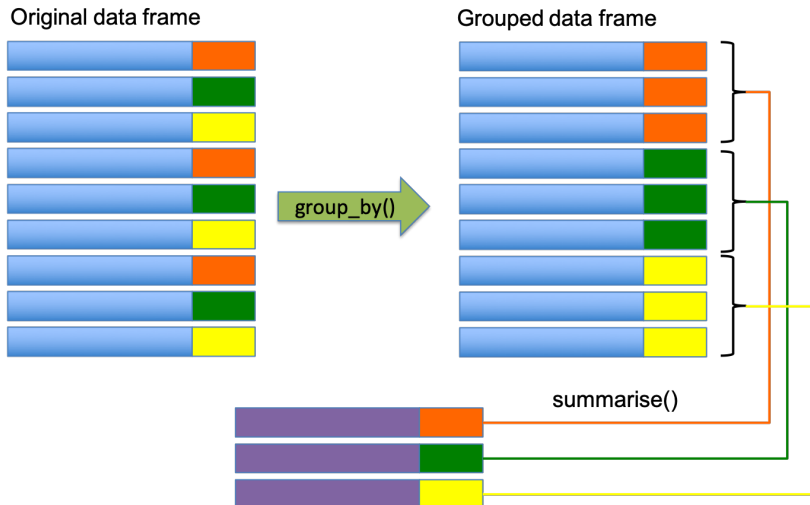

Figure 4: Overall summary process

Useful Summary Functions

Grouping	Examples
Measures of location	mean(), median()
Measures of spread	sd(), IQR(),mad()
Measures of rank	min(), quantile(), max()
Measures of position	first(), nth(), last()
Counts	n(), n_distinct()
Counts and proportions of logical values	sum(x>0) when used with numeric functions, (T,F) converted to (1,0)

Figure 5: Summary Functions

The package nycflights13

```
